

Figure 14. A measure of r-process strength across our parameter space, using a wave frequency of 2×10^3 rad s⁻¹ and $Y_{e,eq} = 0.48$, and assuming the waves immediately shock and begin to deposit heat into the wind. We see that for higher, but still quite reasonable wave luminosities, r-processing takes place nearly independent of PNS mass and neutrino luminosity. The r-processing parameter space broadens to very low wave luminosities at higher masses as the wave stress becomes significant.
